Abstract. The present Red List of Bulgarian Bryophytes includes 251 species (34.9 % of the total bryophyte flora of Bulgaria). Of these, 228 (31.7 %) are Threatened (28 Critically Endangered, 42 Endangered, and 158 Vulnerable), and 23 species are Near Threatened. Further, 37 species are Data Deficient and 24 recently found species are Not Evaluated but are potential candidates for a threat category. The approach to the IUCN categories is described and further priorities for the bryophyte conservation in Bulgaria are outlined.

Key words: bryophytes, Bulgaria, conservation, IUCN threat categories, liverworts, mosses, Red List

Introduction

The preliminary Red List of the bryophytes in Bulgaria included 201 species (59 liverworts and 142 mosses, known from one or two localities), or ca. 30% of all bryophyte species in the country (Ganeva 1998). By the time of this evaluation, 670 species were recorded in Bulgaria (Petrov 1975). According the most recent account 719 bryophyte species occur in Bulgaria (Ganeva & Natcheva 2003; Natcheva & Ganeva 2005; and unpublished data of the authors), of which 543 are mosses, 174 are liverworts, and 2 are hornworts. The intensive inventory studies of many regions in Bulgaria in the last years provided new data for bryophyte distribution and several new species were found (Ganeva & Natcheva 1999; Ganeva 2002; Ganeva & Gecheva 2002; Ganeva & Ros-Espín 2002; Natcheva 2005). The work on the evaluation of habitat quality with implications for habitat conservation in a number of areas gave the opportunity to assess the potential and actual threats experienced by various habitat types (Ganeva 2000a, 2000b; Natcheva 2003). These studies and the recently completed work on compila-

tion of a check-list of Bulgarian bryophytes (Ganeva & Natcheva 2003; Natcheva & Ganeva 2005) provided the basis for a more rigorous evaluation of the threat status of Bulgarian bryophyte flora, taking into account the distribution of the species and the vulnerability of their habitats.

In this paper we present the updated Red List of the bryophytes in Bulgaria.

Methods

We evaluated all bryophyte species from the checklists of the bryophytes in Bulgaria according to the IUCN criteria version 3.1 (IUCN 2001, 2003a, b). The guidelines for application of the IUCN criteria to bryophytes proposed by Hallingbäck (1998) and Hallingbäck & al. (1995, 1998) were followed. The assessment of each species that was assigned a threat category, as well as of those under the Near Threatened and Data Deficient categories was documented according to the IUCN requirements, so that their status could easily be re-evaluated in the future.

Throughout the assessment process we have considered the species' distribution and threat status both in Bulgaria and in the neighbouring countries on the Balkan Peninsula (as far as it is known), as well as the biology and ecology of each species (life history, breeding system, habitat preferences). The information on the abundance of species and their threat status for most of the Balkan countries is highly insufficient and fragmentary (only Serbia and Montenegro have a recently published Red List, Sabovljević & al. 2004). Therefore, we have adopted a conservative approach to the application of the IUCN criteria at national level. The species that: 1) are present in at least four out of five neighbouring to Bulgaria countries, 2) regularly produce spores (most bisexual and some unisexual species), which are small (less than 25 µm, i.e. species with fugitive, colonist s.l., and perennial s.l. life histories, During 1992), and 3) occupy habitats that are relatively common on the Balkan Peninsula, were considered to have a good potential for longer distance dispersal and recolonization from source populations outside Bulgaria. Such species were downgraded one level according the Guidelines for Application of the IUCN Criteria at Regional Levels (IUCN 2003a).

Species requiring specific and vulnerable habitats that are known from one or less than five locations were assigned to the Critically Endangered (CR) and Endangered (EN) categories, respectively. A specific case represent the species that occur in protected areas, because their habitat is protected at least from human activities. Species with less than five locations, all of which are within protected areas, and do not require special management of the habitat, were assigned to the category Vulnerable (VU, criterion D2). If such species had the potential for recolonization from neighboring countries they were considered Near Threatened.

The Red List (Table 1) includes all threatened (CR, EN, VU) bryophyte species, as well as the Near Threatened (NT) taxa. Taxa that have been reported for the country more than 80 years ago and have not been found afterwards, and that are not represented by specimens in any herbarium, as well as taxa that were reported for the country without precise location and that we have not been able to find during our field studies were treated as insufficiently known (DD). They are listed separately in Table 2. There were also a number of species found in the last five years. Whereas some of them may

be recent migrants to the Bulgarian bryophyte flora (e.g. *Sphagnum fimbriatum*, Natcheva 2005), others have probably been overlooked due to their general rarity (e.g. *Drepanocladus longifolius*) or small size and resemblance in the field to some more common species (e.g. *Dicranoweisia cirrata*). These recently found species were assigned to the NE category (Table 3) until more knowledge about their distribution and threat status is acquired.

Summary for the numbers of species under each threat category is presented in Table 4.

The nomenclature follows the one adopted in the check-lists of the bryophytes in Bulgaria (Ganeva & Natcheva 2003; Natcheva & Ganeva 2005).

Results and discussion

The results of the present evaluation applying the IUCN criteria (IUCN 2001) revealed that 34.9% of the bryophytes in Bulgaria are red-listed (under the categories CR, EN, VU and NT). 31.7% of the bryophyte flora of Bulgaria is threatened, i.e. is assigned to one of the IUCN threat categories: CR, EN, and VU. The proportions of threatened mosses and liverworts are similar, with liverworts slightly exceeding (34.9%) the mosses (30.8%). Further 11.7% of the bryophytes in Bulgaria are assigned to other IUCN categories (NT, DD, NE). Although the species under NT, DD, and NE categories are not strictly speaking Threatened, as the term is applied by IUCN, these categories indicate that the species deserve special attention. They are likely candidates for a threat category when more information is acquired (DD and NE), or if their habitats change drastically (NT).

Of the species listed in the *Red Data Book of European Bryophytes* (ECCB 1995) one EN, eight VU, 20 Rare, 10 Regionally Threatened, and eight Insufficiently Known bryophytes occur in Bulgaria. These data and the number of threatened species in the preliminary Red List of Bulgarian bryophytes (Ganeva 1998) could not directly be compared with the results from the present assessment, because other criteria have been used and no regional considerations have been made. However, it must be pointed out that most Rare, Insufficiently Known, and Regionally Threatened species of the European Bryophyte Red List that occur in Bulgaria are Threatened, according to the current evaluation.

One reason for the difference between the present and the preliminary Red Lists may be attributed to the improved knowledge on bryophyte distribution in the country and higher awareness of the habitat vulnerability and threats. Therefore, more species were recognized to be threatened in the present evaluation. Most species from the preliminary Red List (Ganeva 1998) are included in the present Red List. Exceptions are *Bryum bicolor*, *Bryum muehlenbeckii*, *Dicranum polysetum*, *Grimmia sessitana*, and *Schistidium agassizii* that proved to be of lower risk and, therefore, were excluded from the Red List. Furthermore, we are aware that this Red List reflects to a large extent our present state of knowledge regarding the species distribution and the threat status of habitats in Bulgaria, which is generally low as compared with other European countries.

It should be noted that red-listing is a continuous process. With the accumulation of new data some species may change their threat status, others may be excluded from the list, or new species may be included, if their habitats become threatened and their populations decline rapidly. According to the requirements of the Directive 92/43/EEC, a re-evaluation will be conducted every six years in order to reveal trends in the threat status of each species and the entire bryophyte flora of Bulgaria.

The high proportion of threatened bryophytes in Bulgaria is red signal that more active measures are needed for their study and protection. Currently, the only legal act in the country where bryophyte protection is considered is Annex II to the Bulgarian Biodiversity Law (2002), where four species from Annex I of Resolution VI (1979) of the Standing Committee of the Bern Convention and Annex II of the Directive 92/43/EEC are included (*Buxbaumia viridis*, *Dicranum viride*, *Hamatocaulis vernicosus* and *Mannia triandra*). We recommend *Meesia longiseta*, a species from the Directive recently found in Bulgaria (Blockeel & al., in press), to be included in the Annex II of the Bulgarian Biodiversity Law. Some of the populations of many bryophytes fall into the network of protected areas. Thus the stability of their habitats is ensured at least with respect to human activities. Monitoring of bryophyte populations and programs for management of the habitats, especially for bryophytes that require recurrent moderate disturbance of the habitat, are needed with the ultimate goal to ensure the protection of bryophyte biodiversity in the country. The Red List is a first and necessary step in the species protection along the way to achievement of this goal.

Table 1. Red List of the bryophytes in Bulgaria.

Symbols: * species from Annex II of the Directive 92/43/EEC and the Convention on the Conservation of European Wildlife and Natural Habitats (Bern Convention); E, R, V, K, RT species from the *Red Data Book of European Bryophytes* (ECCB 1995) and their respective category (E – Endangered, R – Rare, V – Vulnerable, K – Insufficiently Known, RT – Regionally Threatened).

<i>Scapania helvetica</i> Gottsche	VU	D2
<i>Scapania paludicola</i> Loeske & Müll. Frib.	VU	D2
<i>Scapania scandica</i> (Arnell & H. Buch) Macvicar	EN	B2ab(iii)
<i>Scapania verrucosa</i> Heeg ^R	EN	B2ab(iii)
<i>Trichocolea tomentella</i> (Ehrh.) Dumort.	EN	B2ab(iii)
<i>Tritomaria exsecta</i> (Schmidel) Loeske	VU	D2

Table 2. List of the insufficiently known (DD) bryophytes in Bulgaria.

Abbreviations: E, R, V, K species from the *Red Data Book of European Bryophytes* (ECCB 1995) and their respective category (E – Endangered, R – Rare, V – Vulnerable, K – Insufficiently Known).

Mosses
<i>Aloina rigida</i> (Hedw.) Limpr.
<i>Atrichum angustatum</i> (Brid.) Bruch & Schimp.
<i>Atrichum tenellum</i> (Röhl.) Bruch & Schimp.
<i>Blindia caespiticia</i> (F. Weber & D. Mohr) Müll. Hal.
<i>Bryum creberrimum</i> Taylor
<i>Bryum neodamense</i> Itzigs. ^R
<i>Bryum versicolor</i> A. Braun ex Bruch & Schimp. ^R
<i>Ceratodon conicus</i> (Hampe) Lindb.
<i>Dicranella cerviculata</i> (Hedw.) Schimp.
<i>Dicranum brevifolium</i> (Lindb.) Lindb.
<i>Ephememerum serratum</i> (Hedw.) Hampe
<i>Fissidens exilis</i> Hedw.
<i>Grimmia elongata</i> Kaulf.
<i>Kiaeria falcata</i> (Hedw.) I. Hagen
<i>Microbryum curvicole</i> (Hedw.) R.H. Zander
<i>Orthotrichum scanicum</i> Gronvall ^E
<i>Pohlia longicollis</i> (Hedw.) Lindb.
<i>Pseudephemerum nitidum</i> (Hedw.) Reimers
<i>Pseudoleskeella tectorum</i> (Funk ex Brid.) Kindb. ex Broth.

Liverworts
<i>Racomitrium fasciculare</i> (Hedw.) Brid.
<i>Rhynchostegiella tenuicaulis</i> (Spruce) Kartt. ^K
<i>Rhynchostegium rotundifolium</i> (Brid.) Schimp. ^R
<i>Sphagnum obtusum</i> Warnst.
<i>Tortula mucronifolia</i> Schwägr.
<i>Zygodon forsteri</i> (Dicks. ex With.) Mitt. ^V
Liverworts
<i>Barbilophozia attenuata</i> (Mart.) Loeske
<i>Cephalozia pleniceps</i> (Austin) Lindb.
<i>Cephaloziella massalongi</i> (Spruce) Müll. Frib. ^R
<i>Gymnomitrion apiculatum</i> (Schiffn.) Müll. Frib.
<i>Harpanthus scutatus</i> (F. Weber & D. Mohr) Spruce
<i>Lepidozia cupressina</i> (Sw.) Lindenb.
<i>Marsupella sparsifolia</i> (Lindb.) Dumort.
<i>Metzgeria simplex</i> Lorb. ex Müll. Frib.
<i>Odontoschisma sphagni</i> (Dicks.) Dumort.
<i>Porella obtusata</i> (Taylor) Trevis
<i>Ricciocarpus natans</i> (L.) Corda
<i>Tritomaria scitula</i> (Taylor) Jörg.

Table 3. List of the Not Evaluated (NE) bryophyte species that were reported for Bulgaria in the last five years.

Symbols: * species from Annex II of the Directive 92/43/EEC and the Convention on the Conservation of European Wildlife and Natural Habitats (Bern Convention); R, RT species from the *Red Data Book of European Bryophytes* (ECCB 1995) and their respective category (R – Rare, RT – Regionally threatened).

Mosses					
<i>Acaulon muticum</i> (Hedw.) Müll. Hal					
<i>Amblyodon dealbatus</i> (Hedw.) P. Beauv					
<i>Andreaea obovata</i> Thed.					
<i>Brachythecium mildeanum</i> (Schimp.) Schimp.					
<i>Bryum klinggraeffii</i> Schimp.					
<i>Bryum rubens</i> Mitt.					
<i>Bryum subapiculatum</i> Hampe					
<i>Campyliadelphus elodes</i> (Lindb.) Kanda ^{RT}					
<i>Dicranowisia cirrata</i> (Hedw.) Lindb.					
<i>Drepanocladus longifolius</i> (Mitt.) Par.					
<i>Hedwigia stellata</i> Hedenäs					
<i>Homalothecium aureum</i> (Spruce) H. Rob.					
<i>Hygroamblystegium fluviatile</i> (Hedw.) Loeske					
Liverworts					
<i>Meesia longiseta</i> Hedw.* ^R					
<i>Plagiothecium succulentum</i> (Wilson) Lindb.					
<i>Rhizomnium magnifolium</i> (Horik.) T. J. Kop.					
<i>Scorpidium cossonii</i> (Schimp.) Hedenäs					
<i>Sphagnum fimbriatum</i> Wilson					
<i>Syntrichia ruraliformis</i> (Besch.) Cardot					
<i>Tortula atrovirens</i> (Sm.) Lindb.					
<i>Weissia levieri</i> (Limpr.) Kindb. ^R					

Table 4. Summary of the numbers of bryophytes under each IUCN category and their proportion in the total bryophyte flora of Bulgaria.

IUCN category	Mosses		Liverworts		Total	
	No. of species	Proportion	No. of species	Proportion	No. of species	Proportion
Threat categories						
CR	18	3.3	10	5.7	28	3.9
EN	25	4.6	17	9.7	42	5.8
VU	124	22.8	34	19.5	158	22.0
Total	167	30.8	61	34.9	228	31.7
Other categories						
NT	20	3.7	3	1.7	23	3.2
DD	25	4.6	12	6.9	37	5.1
NE	21	3.9	3	1.7	24	3.3
Total	66	12.2	18	10.3	84	11.7
Total	233	42.9	79	45.2	312	43.4
Total Red-listed (CR, EN, VU, NT)	187	34.4	64	36.6	251	34.9

Acknowledgements We are grateful to Tomas Hallingbäck (ArtDatabanken, Sweden) for the valuable advice regarding the interpretation and application of the IUCN criteria to bryophytes. Marko Saboljević (University of Belgrade) has commented on the earlier version of the manuscript. This work was financed by the Ministry of Environment and Waters of Bulgaria under the project “Red Lists of Vascular Plants and Fungi with Application of the IUCN Criteria”.
