Abstract: The vascular flora of Yeşilırmak Delta (Çarşamba/Samsun/Turkey), second in size among the other deltas in Turkey, was investigated. According to phytogeographical regions, distribution of the 568 species and infraspecific taxa of 340 genera belonging to 91 families instead of "is": identified in the study area are as follows: 22.4% Euro-Siberian, 9.8% Mediterranean, 1% Irano-Turanian, and 0.5% Cosmopolitan. The phytogeographic regions of 66.3 % of the species are unknown.

Key words: vascular flora, wetland

Introduction

Bordering on three different phytogeographical regions (Euro-Siberian, Mediterranean, Irano-Turanian), which present their various topographical and ecological conditions, lying in the transition zone between Northwest Asia and Northeast Europe, Turkey has a rich flora and vegetation types. According to the latest studies, a total of 11 707 vascular plant taxa are distributed in Turkey's flora (Güner & al. 2012).

Delta plains have rich biodiversity, owing to the habitat diversity both of terrestrial and aquatic realms (Tockner & al. 2010). There are sandy habitat types and wetlands, such as floodplain forests, swamps, wet meadows, lakes in the delta plains beside the meadows, and bushes and forest formations that are not inundated (Hillier & al. 2011; Humphries 2011; Kavgaci & al. 2011; Korkmaz & al. 2012; Syvitski & al. 2012).

Besides providing habitats and food for diverse species and supporting the groundwater recharge and water retention and detention, wetlands in the delta

plains allow for maintenance of high water tables and reduce flooding in adjacent ecosystems. Their other critical functions, for example, improvement of water quality by filtering sediments and metals from groundwater, and cycling nutrients to terrestrial and aqueous environments are important not only for the wetlands themselves, but also for the surrounding ecosystems (Greb & al. 2006).

These productive and sensitive areas of the world (van der Maarel 2005) have undergone change and even have disappeared, both owing to natural processes and human-induced impacts since the early ages of history (Matthews & Fung 1987; Mitsch & Gosselink 2007). Stanley & Warne (1997) suggested that the resource-rich environments of the delta plains encouraged prehistoric people to move from the Late Pleistocene terraces and fluvial plains so as to develop sedentary cultures on coastal deltaic lowlands. Changes in sediment input, climatic variations and, more recently, human activities, have played a major role in the delta development during the highstand stage.

The threats to natural ecosystems balance of Yeşilırmak Delta are on the increase, because 65.4% of the area consists of agricultural lands, where plantations of *Pinus pinaster* subsp. *pinaster* on the sandy shore and of *Populus xx canadensis* and *Fraxinus angustifolia* subsp. *oxycarpa* destroy the natural vegetation (Korkmaz & al. 2011), reed is subject to uncontrolled cutting (Mumcu 2010) in the wetlands, and human settlements are widespread.

The floristic and phytosociological characteristics of the eastern part of the Delta were studied by Korkmaz & al. (2011, 2012), while the central and western parts of the Delta were investigated in this study. Our purpose was to analyse the floristic properties of the Yeşilırmak Delta plain by determining the distributed vascular plant species in the area.

Material and methods

Yeşilırmak Delta (Samsun / Turkey), located in the second largest area in the country (Şahin & Bağcı 2016), is one of the 135 wetlands in Turkey defined according to international criteria (Koyuncu & al. 2008). It is formed by Turkey's second largest river, Yeşilırmak, which flows to the Black Sea. ($36^{\circ}23'$ – $37^{\circ}14'$ E and $41^{\circ}05'$ – $41^{\circ}23'$ N). The Delta plain consists of Quaternary alluvial deposits on a total area of 1042.4 km^2 (approximately 22 km long and 88 km wide). The elevation of the plain is only about 0–15 m. The Delta is covered by periodically flooded meadows, some lagoons and numerous drainage channels. The soils in the research area are alluvial, fed by Yeşilırmak and Terme rivers. They are composed of fine silt and clay grains in the surface and subsurface layer, and sand grains deeper down (Erdaş & al. 1992).

The study area is exposed to the rainy Mediterranean climate ($Q = 113,3$) and is subject to the West Mediterranean precipitation regime (Au, Wi, Sp, Su) (Akman 1990). The mean annual temperature is 14.4°C and the average total annual precipitation is 848 mm.

The plant samples were gathered weekly during three vegetation cycles (2013, 2014, 2015). Most samples were identified according to the *Flora of Turkey and East Aegean Islands* (Davis 1965–1985), and by means of relevant publications (Tutin & al. 1964–1993; Irwin & Barneby 1982a, b; Nesom 1994;

Mutlu 2004; Aslan & al. 2009; Baldwin & al. 2012; Verloove & Gullón 2012; URL-1) for the taxa that are not included in it. The plant list is arranged alphabetically after checking the plants systematically, chorologically and for endemism according to Güner & al. (2012). The samples are stored in the Herbarium of Ondokuz Mayıs University, Faculty of Arts and Sciences, Department of Biology (OMUB).

The Plant List is preceded by a list of plant collection stations under the name of Station List. After specific and infraspecific taxon names, the Plant List features the station number, date, phytogeographical region, endemism, and collection number related to the taxon. The taxa, which represent a cultured form, are marked with "*", and the taxon names of alien origin are marked with "**". Conservation status of the taxa has been evaluated according to the *Red Data Book of Turkish Plants* (2000) and IUCN (URL-2).

Station List

- (1) Tekkeköy, Ovabaşı village, *Sambuco-Carpinetum* community, 15m., $41^{\circ}12'30.59''\text{N } 36^{\circ}29'42.93''\text{E}$; (2) Çarşamba, Taşdemir village, *Sambuco-Carpinetum* community, 18m., $41^{\circ}12'07.59''\text{N } 36^{\circ}34'30.98''\text{E}$; (3) Çarşamba, Çaltı village, *Platanthero-Fraxinetum* community, 4m., $41^{\circ}15'21.51''\text{N } 36^{\circ}34'38.35''\text{E}$; (4) Çarşamba, İrmaksırtı village, *Platanthero-Fraxinetum* community, 8m., $41^{\circ}15'21.51''\text{N } 36^{\circ}34'38.35''\text{E}$; (5) Çarşamba, Hürriyet village, *Sambuco-Alnetum* community, 4m., $41^{\circ}19'26.37''\text{N } 36^{\circ}36'36.40''\text{E}$; (6) Çarşamba, Hürriyet village, *Sambuco-Alnetum* community, 5m., $41^{\circ}19'08.36''\text{N } 36^{\circ}36'17.60''\text{E}$; (7) Çarşamba, Çaltı village, *Verbasco-Elaeagnetum* community, 1m., $41^{\circ}17'15.22''\text{N } 36^{\circ}34'01.64''\text{E}$; (8) Çarşamba, İrmaksırtı village, *Verbasco-Elaeagnetum* community, 3m., $41^{\circ}16'37.97''\text{N } 36^{\circ}33'00.88''\text{E}$; (9) Çarşamba, Hürriyet village, *Salicornio-Juncetum* community, 3m., $41^{\circ}20'44.53''\text{N } 36^{\circ}37'02.28''\text{E}$; (10) Çarşamba, Fener District, *Salicornio-Juncetum* community, 2m., $41^{\circ}21'17.94''\text{N } 36^{\circ}37'30.62''\text{E}$; (11) Çarşamba, Hürriyet village, *Junco-Tamaricetum* community, 2m., $41^{\circ}20'49.86''\text{N } 36^{\circ}37'26.39''\text{E}$; (12) Çarşamba, Fener District, *Junco-Tamaricetum* community, 2m., $41^{\circ}22'08.37''\text{N } 36^{\circ}39'03.68''\text{E}$; (13) Çarşamba, Hürriyet village, *Eryngio-Pancratietum* community, 1m., $41^{\circ}21'01.14''\text{N } 36^{\circ}36'42.09''\text{E}$; (14) Çarşamba, Çaltı village, *Eryngio-Pancratietum* community, 0,5m., $41^{\circ}17'41.65''\text{N } 36^{\circ}34'22.02''\text{E}$; (15)

Floristic analysis

Yeşilırmak Delta is a place, where natural ecosystems are seriously damaged, due to widespread disturbance. Disturbance promotes diversity by delaying the elimination of some species due to competition, because it causes interruptions in the system's balance (Hub-

bell 1979). In the study area, 568 specific and infraspecific taxa of 340 genera, belonging to 91 families have been identified. Of these taxa, seven belong to the Pteridophyta division and the remaining 561 belong to the Magnoliophyta division. Of the taxa in the study area, only two are included in the Pinophytina subdivision, while 559 are in Magnoliophytina subdivision.

The first ten families of these taxa with the greatest number of species are: *Poaceae* (66), *Asteraceae* (59), *Fabaceae* (40), *Lamiaceae* (29), *Cyperaceae* (28), *Caryophyllaceae* (20), *Apiaceae* (18), *Brassicaceae* (18), *Plantaginaceae* (18), and *Amaranthaceae* (16). The genera with the greatest number of species are: *Carex* (15), *Euphorbia* (13), *Trifolium* (11), *Juncus* (10), and *Veronica* (10).

Generally, these families have the largest number of species in Turkey's flora, and similar results are expected for the research area. Besides, the high number of species belonging to *Carex* and *Juncus* genera results from the widespread floodplain areas and wetlands in the study area. The species belonging to these taxa have aeranchymatic tissues and usually prefer moist places or wetlands (Rydin & Jeglum 2013). *Euphorbia* species have become widespread in the study area, because they are disregarded by sheep and cattle and are not affected by grazing (Lym & Kirby 1987; Tanveer & al. 2013). The *Poaceae* family and genus *Trifolium* comprise taxa with the greatest number of species in meadow and pasture habitats in Turkey (Korkmaz & al. 2011; Yalçın & al. 2011; Öztürk & al. 2012; Deveci 2012).

According to distribution in the phytogeographic regions, 127 taxa are Euro-Siberian (22.4 %), 56 taxa are Mediterranean (9.8 %) and five taxa are Iran-Turanian elements (1 %), three taxa are Cosmopolitan (0.5 %), and the remaining 377 taxa are pluriregional or phytogeographically unknown (66.3 %) (Fig. 1). As the research area is located in the Black Sea region, quite naturally, the elements of the Euro-Siberian floristic region, which prefer cool and rainy climate, are common in that area (Kaya & Raynal 2001). The elements of the Mediterranean floristic region are more prevalent in the coastal dune habitats of the research area, as the species, which belong to the warm and dry Mediterranean climate, prefer the local arid climate conditions there (Kavgacı 2007; Yalçın & al. 2011). The presence of diverse pluriregional taxa could be explained by lack of information about the distribution of some taxa, or by the fact that the areas have suitable conditions for many species (Elmas & Kutbay

2017), because delta areas are generally exposed to anthropogenic effects (agriculture, grazing, settlements, etc.), and diaspora migration, owing to birds, cattle, sheep and transportation means.

Endemic species in the study area are *Bupleurum setaceum* (Mediterranean element), *Crepis macropterus* (Irano-Turanian element), *Helichrysum arenarium* subsp. *aucheri* (Irano-Turanian element), and *Inula helenium* subsp. *orgyalis* (Euro-Siberian element), and the endemism rate is quite low (0.7%). Because Yeşilırmak Delta is an alluvial delta, it is a region where topographic and ecological isolation effects are not found (Daubenmire 1978; Nimis & Crovello 1991). Thus, isolations based on endemism have not been noticed in the study area, and due to anthropogenic effects, many alien species are becoming widespread in the area.

According to IUCN (URL-2), when the taxa are evaluated on a global scale, the population of one of the 568 taxa (*Juglans regia*) is decreasing and has NT (Near Threatened) status; four taxa have DD (Data Deficient) status. The population of three out of 124 species with LC (Least Concern) status is also declining. According to the *Red Data Book of Turkish Plants* (2000), two of the taxa are Endangered (*Pancratium maritimum* and *Ambrosia maritima*), five are Vulnerable (*Salvinia natans*, *Galanthus rizehensis*, *Leucojum aestivum* subsp. *aestivum*, *Sium sisarum* var. *lancifolium* and *Myosotis sparsiflora*), three are LC (*Bupleurum setaceum*, *Crepis macropterus* and *Helichrysum arenarium* subsp. *aucheri*), and two are DD (*Medicago truncatula* var. *truncatula* and *Polygonum longipes*). Although the generations of many species spread in the study area are not under great threat, their distribution should be monitored closely as it depends on threatened habitats such as wetlands and sands.
